## Seismic Risk Assessment

*Johan Hanekom*  
*Friedemann Essrich*  
*Heinrich Greeff*

11 June 2024

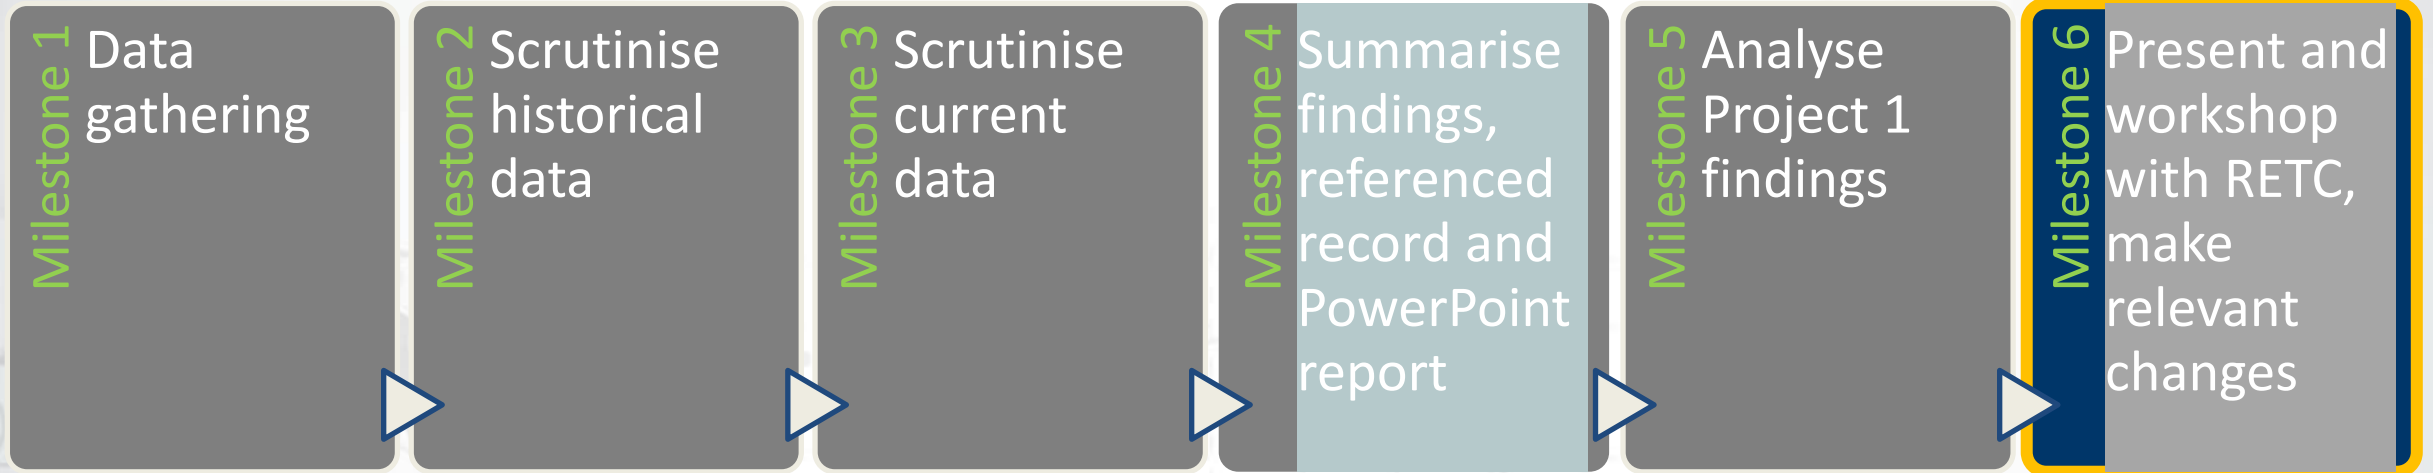

# Scope

## *CSIR scope of work*

- ✓ Item C: Review of local seismic risk management practice for platinum and gold mines in South Africa.
- ✓ Item D: Gap analysis conducted within findings provided by all contributors to the overall Project 1 scope of work, on Items A through C.
- ✓ Item E: Workshop to present overall findings of Project 1.

# Milestones

•Summarise current seismic risk management practice (local and international), including seismic hazard assessment, ground motion, source mechanisms, damage mechanisms, geotechnical data used, modelling, mine design, support systems, re-entry protocols, TARP systems, etc. Short-, medium-, and long-term risk management strategies should also be examined.

•The review should include the education level, skills, and experience of personnel responsible for seismically active operations.

# Milestone 4 results

## Rock Engineering Actions in the Code of Practice

- How are the seismic hazards identified on South African mines?
  - Before mining commences
  - During mining operations
- What influences the seismic risk of the identified hazards?
- Which Rock Engineering actions take place to manage seismic risk?
  - Before mining commences
  - During mining operations
- What seismic control procedures are implemented on operations.
- Seismology and Rock Engineering Survey Results

## Sibanye Rustenburg Operations

- Conduct Seismic Hazard Assessment
  - Establish Seismogenic Zones
- Design Mining Strategies and Precautions
- Analyse Geological and Structural Factors
  - Assess Groundwater-Related Hazards
  - Evaluate Temperature and Gas Hazards

### Seismic Hazards:

- Geological Structures (Faults and Dykes)
- Mining Faces
- Stabilizing Pillars
- Abutments
- Isolated Blocks
- Rock Mass Properties

### Factors Influencing Seismic Activity:

- Evaluation of frequency of geological features
- Angle of approach
- Mining span
- Rate of mining
- Extraction sequence
- Regional support system characteristics.

- Impact of Mining Activities on Neighbouring Mines
  - Blasting Practices
  - Drilling Techniques
  - Sidewall and Face Stability
  - Pre-conditioning
- Seismic Monitoring and Control
  - Seismic Hazard Assessment
  - Routine Monitoring
  - Rock Conditions
  - Blasting Effects on Rock
- Rock Failure and Deformation
  - Hanging wall Stability
  - Fault and Wedge Hazards
  - Rockburst Hazards
- Poor Blasting Practice Effects
  - Rock Drill Vibrations
- Support Design and Quality Assurance
  - Support Design Guidelines
  - Long Term Support
  - Support Scheduling
  - Support Optimization
- Mining Process Improvement
- Safety Innovation and Planning
  - Management and Planning
  - Mine Layout and Design
- Ground Control Districts Management
- Ground Control and Structure Management
  - Seismicity Monitoring
- Blasting Techniques Improvement
  - Mining Layout Optimization
  - Tunnel Stability
  - Surface Protection
  - Code of Practice Updates
  - Risk Management
- Continuous Support and Monitoring
- Rock Engineering Audits and Training
- New Support Methods Introduction
  - Rock Burst Prevention
- Preconditioning and Stress Management
  - Seismic Activity Monitoring
  - Stress Condition Management
  - Proximity Risk Management
  - Excavation Planning
- Multi Reef Mining and Stability
  - Subsidence Control
  - Pillar Design and Stability
  - Stopping Design and Safety
  - Emergency Preparedness

# Rock Engineering Actions Sibanye Rustenburg Operations

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments
  - Isolated Blocks
  - Rock Mass Properties

- Factors Influencing Seismic Activity:**
- Evaluation of frequency of geological features
  - Angle of approach
  - Mining span
  - Rate of mining
  - Extraction sequence
  - Regional support system characteristics.

Prior to Mining

During Mining

# Rock Engineering Actions Target – Harmony

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments
  - Isolated Blocks
  - Rock Mass Properties

- Factors Influencing Seismic Activity:**
- Evaluation of frequency of geological features
  - Angle of approach
  - Mining span or Panel Length
  - Rate of mining
  - Extraction sequence
  - Regional support system characteristics.

Prior to Mining

During Mining

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments

**Influencing Seismic Activity:**  
• Evaluation of frequency of geological features  
• Angle of approach  
• Mining span  
• Rate of mining  
• Extraction sequence  
• Regional support system characteristics.

During Mining

# Rock Engineering Actions Driefontein - Sibanye

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments
  - Isolated Blocks
  - Rock Mass Properties

- Factors Influencing Seismic Activity:**
- Evaluation of frequency of geological features
  - Angle of approach
  - Mining span
  - Rate of mining
  - Extraction sequence
  - Regional support system characteristics.

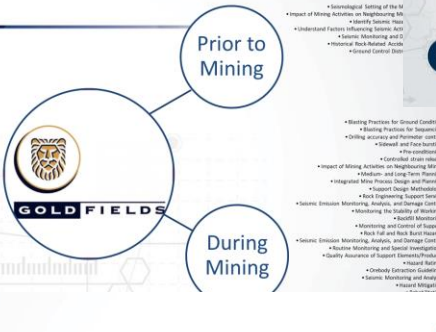

Prior to Mining

During Mining

# Rock Engineering Actions Goldfields – South Deep

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments

- Factors Influencing Seismic Activity:**
- Evaluation of frequency of geological features
  - Angle of approach
  - Mining span
  - Rate of mining
  - Extraction sequence
  - Regional support system characteristics.

Prior to Mining

During Mining

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments

- Factors Influencing Seismic Activity:**
- Evaluation of frequency of geological features
  - Angle of approach
  - Mining span
  - Rate of mining
  - Extraction sequence
  - Regional support system characteristics.

Prior to Mining

During Mining

- Identification of Geological Discontinuities
- Geotechnical Stress Assessment
- Preliminary Seismic Risk Assessment
- Pre-emptive Seismic Monitoring System
- Seismic Event Classification
- Rock Burst Preparedness
- Face Perpendicular Preconditioning
- Stress Management
- Seismic Activity and Mining Cycle
- Ground Control Districts (GCD) Management
- Mining Direction and Ground Control
- Geological Discontinuities and Structures Management
- Mining Induced Seismicity Monitoring
- Stress-Related Damage Prevention
- Continuous Blasting Techniques Improvement
- Optimized Mining Layout and Sequencing
- Effective Pillar Design and Support Systems
- Tunnel Stability Measures
- Surface and Mine Access Protection
- Code of Practice Updates
- Rock-related Risk Management in Development and Long Term Phase
- Tunnel Support Types and Design Optimization
- Support Prioritization and Scheduling
- Control of Rock-related Hazards in Tunnels
- Continuous Improvement in Mineral Excavation Process (Stoping)
- Slope Stability and Instability Controls
- Continuous Innovation and Safety Improvement

- Seismic Hazards:**
- Geological Structures (Faults and Dykes)
  - Mining Faces
  - Stabilizing Pillars
  - Abutments
  - Rock Mass Properties

- Factors Influencing Seismic Activity:**
- Evaluation of frequency of geological features
  - Angle of approach
  - Mining span
  - Rate of mining
  - Extraction sequence
  - Regional support system characteristics.

Prior to Mining

During Mining

- Seismological Setting of the Mine
- Identify Seismic Hazards
- Specific Faults and Dykes
- Seismic Monitoring and Data
- Historical Rock-Related Accidents
- Ground Control Districts
- Continuous Assessments and Technical Support
- Modification of Mining Methods
- Ongoing Monitoring and Support Systems
- Mining Layout and Multi-Beef Mining
- Subsidence Control Measure
- Pillar Design and Stability Control
- Stopping Design and Rock Breaking
- Emergency Preparedness
- Post-Incident Evaluation and Remediation
- Rock Engineering Audits and Reviews
- Rock Engineering Training and Competence
- Continuous Improvement

# What influences the seismic risk of the identified hazards?

## Seismic Hazards:

- Geological Structures (Faults and Dykes)
- Mining Faces
- Pillars
- Abutments
- Isolated Blocks
- Rock Mass Properties

## Factors Influencing Seismic Activity:

- Evaluation of frequency of geological features
- Angle of approach
- Mining span or panel length
- Rate of mining
- Extraction sequence
- Regional support system characteristics – Energy absorption calculations

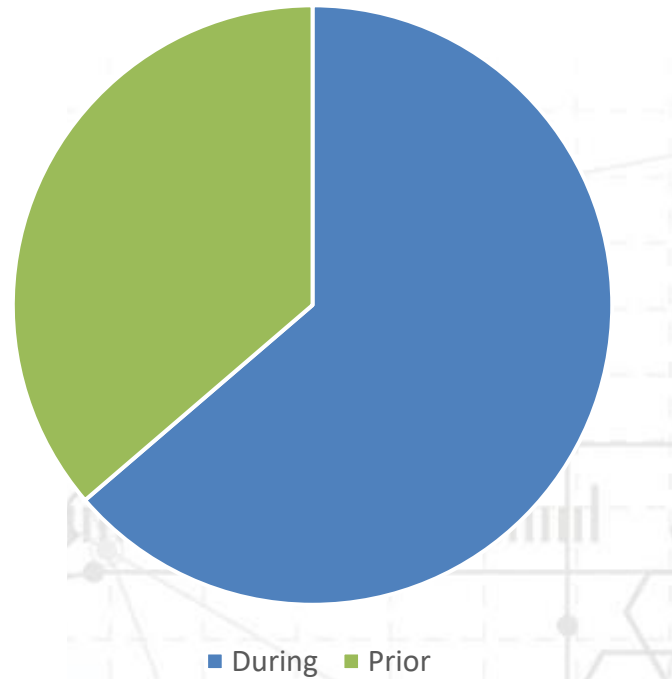

# Rock Engineering Actions

## Rock Engineering Actions During Mining Operations

### Rock Engineering Actions Prior to Mining

- Seismological Setting of the Mine
- Impact of Mining Activities on Neighbouring Mines
- Identify Seismic Hazards
- Understand Factors Influencing Seismic Activity
- Seismic Monitoring and Data
- Historical Rock-Related Accidents
- Ground Control Districts
- Geological Setting Considerations
- Specific Faults and Dykes
- Risk Assessments
- Fracture Zones and Rock Conditions
- Rock Engineering Strategies
- Ground Control Strategies
- Geological Considerations
- Management and Qualifications
- Mine Layout and Support Design
- Safety Measures
- Mining Processes
- Specific Challenges
- Support Systems
- Identification of Geological Discontinuities
- Geotechnical Stress Assessment
- Preliminary Seismic Risk Assessment
- Pre-emptive Seismic Monitoring System
- Conduct Seismic Hazard Assessment
- Establish Seismogenic Zones
- Design Mining Strategies and Precautions
- Analyze Geological and Structural Factors
- Assess Groundwater-Related Hazards

### Rock Engineering Actions

There are a substantial number of rock engineering related actions taken during mining.

- Impact of Mining Activities on Neighbouring Mines
- Blasting Practices and Effects
- Drilling Techniques and Accuracy
- Sidewall and Face Stability
- Pre-conditioning and Controlled Strain Release
- Seismic Monitoring, Hazard Assessment, and Control
- Monitoring and Analysis of Seismic Events
- Historical Rock-Related Accidents
- Ground Control Districts Management
- Geological and Seismological Considerations
- Risk Assessments and Mitigation
- Fracture Zones, Faults, and Rock Conditions
- Rock Engineering and Support Strategies
- Mine Layout, Support Design, and Multi-Reef Mining
- Safety Measures and Emergency Preparedness
- Mining Processes and Challenges
- Support Systems and Optimization
- Identification of Geological Discontinuities
- Geotechnical Stress and Preliminary Seismic Risk Assessment
- Pre-emptive Seismic Monitoring System
- Designing Mining Strategies and Precautions
- Analyzing Geological, Structural Factors, and Groundwater-Related Hazards
- Evaluating Temperature and Gas Hazards
- Rehabilitation and Continuous Improvement
- Rock Fall, Burst Hazards, and Damage Control
- Backfill, Stability Monitoring, and Control of Support
- Orebody Extraction Guidelines and Hazard Ratings
- Participation in Planning, Continuous Assessment, and Technical Support
- Modification of Mining Methods and Ongoing Monitoring
- Rock Engineering Audits, Reviews, Training, and Competence
- Introduction of New Support Products and Methods
- Face Perpendicular Preconditioning, Stress Management, and Seismic Activity Management, Qualifications, and Integrated Mine Process Design
- Ground Control Districts (GCD) Management and Mining Direction
- Groundwater-Related Hazards and Geological Discontinuities Management
- Mining-Induced Seismicity Monitoring and Stress-Related Damage Prevention
- Continuous Blasting Techniques Improvement and Optimization
- Effective Pillar Design, Support Systems, and Tunnel Stability Measures
- Surface and Mine Access Protection, Code of Practice Updates, and Rock-related Risks Management
- Tunnel Support Types, Design Optimization, and Support Prioritization
- Control of Rock-related Hazards in Tunnels and Continuous Innovation for Safety Improvement

# Operational Review – Shallow vs Deep Summary

Items and processes that were repeated in each of the COPs regardless of mining depth and/or commodity:

## Similarities:

- Seismic Hazard Identification
- Seismic Risk Management
- Induced Seismicity
- Fault-slip
- Influence of Geology

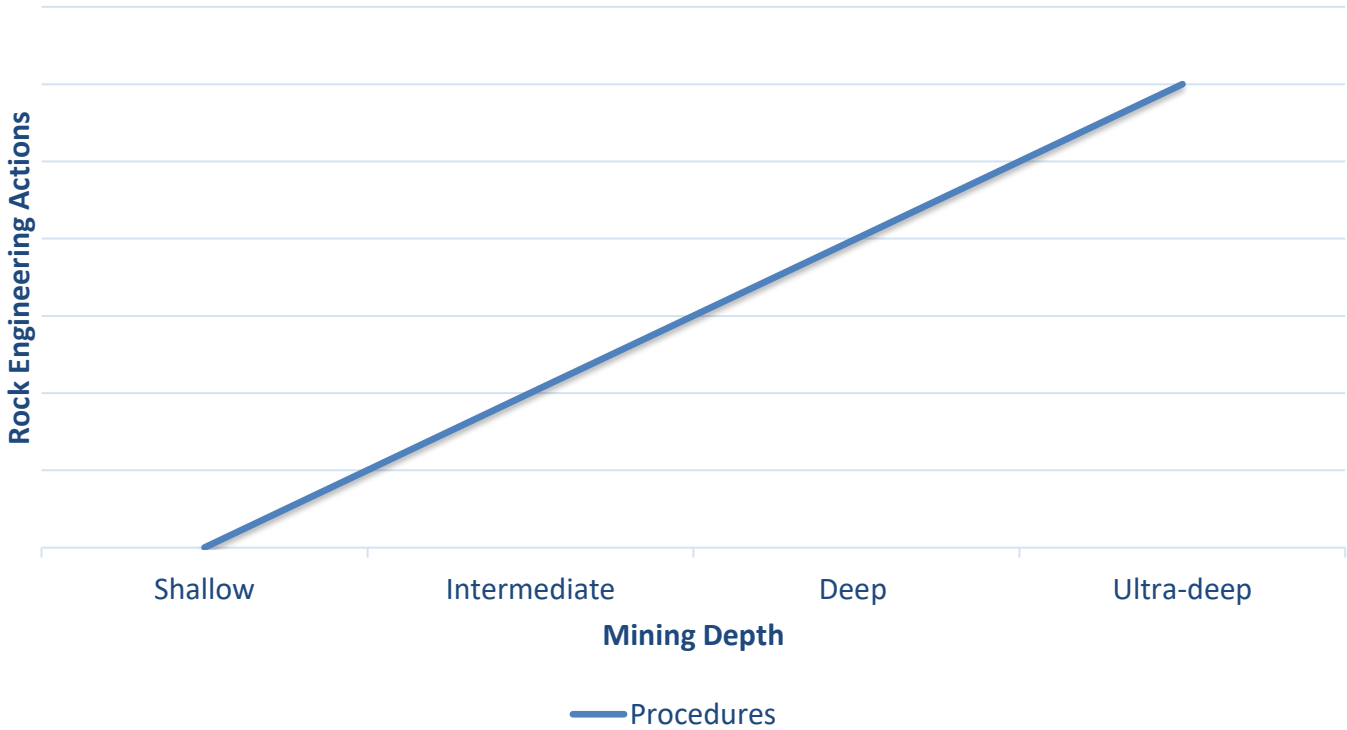

Items and processes that were different between COPs with depth of mining and commodity being major factors:

## Differences:

- Depth and Stress
- Rock Mass Properties
- Seismic Sources
- Impact and Consequences

# Operational Review – Shallow vs Deep Summary

## Rock Engineering Actions vs Mining Depth

# Operational Review – Shallow vs Deep Summary

# Surveys

## Rock Engineering and Seismic Risk Management

- Rock Engineering survey
  - A number of leading mines were selected to receive a survey evaluating Rock Engineering and Seismic Risk Management at the mine level.
  - The survey was distributed to all members of the Rock Engineering department involved in Seismic Risk Management.
  - The questions were designed to gauge experience levels and to test individual opinions and comfort levels when dealing with seismic terminology.
  - The answers to the questions are presented without filtering.

# Rock Engineering Survey

## Respondent seniority level

Which best describes your Rock / Geotechnical Engineering Level in your Department:

24 responses

- Officer - Strata Control
- Engineer - Rock / Geotech / Geotechnical
- Senior Engineer - Rock / Geotech / Geotechnical
- Manager/Superintendent - Rock / Geotech / Geotechnical

# Rock Engineering Survey

## Respondent experience in rock engineering

How many years of Rock / Geotechnical Engineering experience do you have:

24 responses

76% has more than 10 years Rock Engineering experience.

# Rock Engineering Survey

## Respondent experience with mine seismology

How many years of seismic exposure do you have (i.e. working on a mine with seismicity):  
24 responses

76% has more than 10 years Rock Engineering experience.

# Rock Engineering Survey

## Respondent knowledge of mine seismology

Do you feel that your knowledge of seismic systems and seismic data analysis is adequate to make a good call on implementing protocols to keep your production crews safe?

24 responses

# Rock Engineering Survey

## Respondent Qualifications

Please select all your qualification(s):

24 responses

# Rock Engineering Survey

## Seismic reports used by Rock Engineers

Which periodic Seismic Reports do you find useful (you can select multiple options):

24 responses

# Rock Engineering Survey

## Role of Rock Engineer ito seismic data

What do you believe the role of the Rock / Geotechnical engineer is in assessing and addressing seismic activity on the mine:

24 responses

The Rock / Geotechnical engineering department will review the seismic data analysis done by seismologists and use the seismologist recommendations in planning and recommendations to production personnel. The Rock / Geotechnical engineering department does not have to be experts in seismology as they contract seismic service providers to interpret seismic responses to mining.

The Rock / Geotechnical engineering department must plan their seismic system layout, conduct seismic data analyses, and have a deep understanding of how to read and control seismic activity. The Rock / Geotechnical engineering department must be absolute experts in seismology and should not rely solely on the input from seismologists.

Seismic activity and the study of seismology should not be a Rock / Geotechnical engineering function. The seismic experts should be a separate function on the mine that consults directly with production personnel.

# Rock Engineering Survey

## Respondent ability to affect protocols

On your mine, are you able to identify the shortfalls or improve on the predefined protocols for adjusting mining operations based on seismic activity?

24 responses

# Rock Engineering Survey

## Confidence placed on received 'Alerts'

If a periodic report is "GREEN" or there are "NO ALERTS" in the report, do you accept the report or conduct your own review and analysis of the period represented by the report?

24 responses

- Yes, I accept and trust the results and do not feel the need for further questions/queries from my side. I expect the report to be accurate.
- Yes, I accept the report but will always conduct my own analysis too.
- Yes, I accept the report but will sometimes conduct my own analysis.
- No, I do not accept the report as final and will always conduct my own analysis.

# Rock Engineering Survey

## Well-understood seismic parameters

**Which seismic parameter(s) are you most comfortable with?**

**Name the seismic parameters you use and understand (from the top of your head):**

- Event rate and distribution.
- Large indicator, Activity rate, Potency
- Lead/lags and Face shape
- Location, activity rate, potency, Local Magnitude, Moment, Energy
- Moment, time, energy, XYZ, mechanism
- X Y Z, time, energy moment
- Seismic moment, time, location
- Activity rate
- Event Magnitude, b-value, P-wave, S-wave, slip or crush event, seismic moment, peak particle velocity
- magnitude
- Magnitude, Seismic Moment
- Magnitude
- Magnitude, Sensitivity, Clustering, Activity rate, Source failure mechanism, after shock
- local magnitude, potency, ERR, ESS
- seismic activity
- Cum Apparent Volume, Schmidt number, Energy Index, Activity rate
- Time, location, energy, moment, hazard magnitude, Schmidt number, activity rate, clustering, source parameters potency, cumulative apparent volume,
- Potency
- Knowledge of different parameters are difficult to understand.
- Moment-tensor decomposition, potency, local magnitude, ToD distribution, location accuracy (cloud), off-shift/on-shift percentage, mMax, Gutenberg-Richter analysis, clustering
- Potency / Production, Cumulative displacement, ERR
- Magnitude of potential damaging seismic events, location (clustering), number of events in a given period, potency, source mechanism, probability of reoccurrence
- Seismic Potency
- NONE

# Rock Engineering Survey

## Confusing seismic parameters

**Which seismic parameter(s) confuse you?**

**Name (up to three) parameters you stay away from using because they are confusing to you.**

- Schmidt number, seismic latency
- Schmidt, EI index
- Not applicable
- Debora's number, Schmid number,
- Time, energy, location
- Potency, EI Index, Activity, Schmidt, Events
- None
- Schmidt number
- seismic moment
- focal mechanism plots
- Debora number, Energy Index, Seismic Schmidt number
- None
- Potency, Moment Tensor,
- Moment tensor
- Schmidt number
- Any analysis in time domain without including the driver like volume mined.
- None
- None
- Knowledge of different parameters are difficult to understand
- Moment magnitude
- Schmidt Index, Sum of Moment & Energy, Normalized activity Rate
- Moment tensor, PGV, Total energy

# Rock Engineering Survey

## Preferred and important seismic parameters

Are there specific parameters you prefer to use when planning and sequencing mining operations? Name the top parameter(s) that you consider vital to your planning.

- Using the SRP graphs and potency
- Lead/Lags and Face shape
- Cumulative Potency normalized to cumulative production
- Mechanism, location
- Monthly seismic Rating, Magnitude, Mechanism, Hazard Map
- Local magnitude, frequency of occurrences, mining geometry and presence of adverse geology
- Numerical modeling incorporating seismic history
- Energy release rate
- ESS; Lead and Lags
- Magnitude, Energy Release Rates
- No
- Probability of reoccurrence, magnitudes, ERR, ESS
- Seismic activity rate
- Activity rate
- Clustering, source parameters, activity rate, location, potency, production rates.
- Stress, ERR, ride/potency, RCF
- Knowledge of different parameters are difficult to understand
- Time-of-day distribution, cumulative potency/production, damaging or large event frequency, event location, raise line seismic hazard ranking
- ERR's, Sigma 1
- Probability of reoccurrence, expected magnitudes and related damages, clustering of events

# Rock Engineering Survey

## Implementation of seismic data

Are there instances where you have adjusted monthly planning and sequencing proposed by the production personnel (monthly planning meeting), based on findings from seismic reports?

22 responses

# Rock Engineering Survey

## Most used re-entry protocols

When you receive a seismic report which is “RED” or there are “CRITICAL ALERTS” which according to protocol, stops a working place and withdraws t...re-entry procedure you are most comfortable with:

24 responses

- The seismologist will let me know when critical parameters have recovered, an...
- The seismologist monitors seismic activity and updates me of changes at...
- I will provide my manager with the latest available information from the seismol...
- I do not rely on further feedback from the seismologist; I am familiar with my...
- This is not a decision that can be mad...
- monitor rating until reduces to modera...

# Rock Engineering Survey

## Mine seismology training to date

Have you received training on seismic systems and seismic data analysis (you can select more than one answer)?

24 responses

# Rock Engineering Survey

## Mine seismology training needs

Do you feel you need more seismic training to (effectively) do what is expected of you as a Rock / Geotechnical engineering representative?

24 responses

- Yes, I need more training.
- No, I am comfortable with my level of understanding.
- Any training is welcome
- knowledge can always be improved.

# Rock Engineering Survey

## Impact of mine seismology reports on planning

Do periodic seismic reports govern your mine planning? Select the best option from the list below.

24 responses

- No, there are other factors that are more important than seismic activity.
- Yes, I log the trends of daily reports and use this in mine planning.
- Yes, I log the trends of monthly seismic reports for mine planning.
- Yes, I log the trend of seismicity and use this in my mine planning.
- We are not able to predict seismic behaviour and although I cater for it in...

# Rock Engineering Survey

## Mine seismology reports as 'critical' information

When you arrive at the office in the morning, do you consider seismic reports a critical report to review daily or only when there are seismic alerts?

24 responses

- Yes, I review my daily seismic reports and communicate the status to my mine overseers.
- No, I do not receive daily reports.
- No, there are other reports more important than seismic activity, like su...
- I will review my daily report if there are concerns raised in it.
- I review seismic reports daily. Communicate concerns

# Rock Engineering Survey

## Communication method with seismologists

How do you communicate with the seismologist (you can select multiple options)?

24 responses

# Rock Engineering Survey

## Mine seismologist communication impact

Do you feel the communication and service from your seismologist is satisfactory and empowers you to make confident decisions?

24 responses

# Rock Engineering Survey

## Mine seismology software packages

Are you able to operate software packages that display and analyze seismic data?

24 responses

- Yes
- No
- Yes but I would like more training to be comfortable with this task.
- No as most data is viewed by seismologist and we only see reports. It is a draw back in the system and needs to be changed so everybody can access data. seismic data without in-depth knowledge of the mining layout and vo...

# Operational Review – Shallow vs Deep Summary
